SUMMARY

Software engineer: backend systems, cloud infrastructure, and applied LLM work. Three years of increasing ownership on a production AI language-learning product: intern, junior engineer, then cloud and infrastructure, where I led the migration of the production stack from AWS to low-cost infrastructure, cutting spend by roughly 85%. I build evaluation systems for AI output and treat quality, cost and latency as engineering constraints. First Class BSc in Computer Science (KNUST), ALX backend specialisation.

EXPERIENCE

Software Engineer, Cloud & Infrastructure - Amazethu (Remote)

January 2026 - Present

- Lead the low-cost infrastructure project: documented the production AWS estate, built the provider comparison and decision framework, and executed the phased migration to Render (heaviest service first) with tag-based GitHub Actions deploys, DNS and SSL cutover, and end-to-end validation.
- Runs staging and production at roughly one sixth of the previous AWS cost; keeps cost, spin-up latency and reliability in explicit balance.
- Built evaluation systems for the LLM tutor: local testbed with simulated students, content review pipelines, and quality control workflows.
- Direct hiring strategy (questionnaire to 90 candidates, two-stage filtering, interviews) and retention analytics; found and fixed an event-design flaw in signup tracking.

Junior Software Engineer - Amazethu (Remote)

April 2025 - January 2026

- Shipped features across React, Node.js/Express and Python (FastAPI), including a Google Calendar reminder feature with recurrence rules.
- Drove QA automation with Playwright user-flow tests and automated alerts, cutting deployment errors by 20%.
- Mentored interns, ran technical interviews, and standardised code quality (ESLint, Black, JSDoc).

Software Engineer, National Service then ICT Assistant - KNUST University IT Services

November 2023 - January 2025

- Built TekNotify, a bulk messaging system (Django, RabbitMQ, Celery, Paystack payments), and a C#/ASP.NET endowment system.
- Database modelling, stored procedures, Sphinx documentation, PWA and Blazor exploration.

SKILLS

Languages: Python, TypeScript, JavaScript, C, C#, SQL
Frameworks: Django, DRF, Flask, FastAPI, Node.js, Express.js, React, Redux, Tailwind CSS, ASP.NET Core
Databases: PostgreSQL, MongoDB, MySQL, SQLite, MSSQL
Cloud & DevOps: AWS, Render, Docker, GitHub Actions, Nginx, HAProxy, Linux, Firebase, MongoDB Atlas
AI & Quality: LLM evaluation harnesses, simulated-user testing, prompt and content pipelines, Playwright, TDD, CI/CD

RESEARCH & PROJECTS

The Perfectionism Trap (2025): measured semantic drift from iterative AI suggestions across 50 rounds (similarity 1.0 to -0.13); experimental pipeline with alternating LLMs and Sentence Transformer metrics. github.com/alemyaobed/ai-perfectionism-and-semantic-drift
cu.rl: URL shortener with platform, OS and location analytics (Django, DRF, PostgreSQL).

EDUCATION

BSc Computer Science, First Class Honours, KNUST (2019 - 2023); ALX Software Engineering Program, backend specialisation (2023 - 2024). Second place, DIGILOG Hackathon 2023.
